

Chapter 10

Classes: A Deeper Look,

Part 2

Yu-Shuen Wang, CS, NCTU

10.2 `const` (Constant) Objects and `const` Member Functions

- ▶ You may use keyword **const** to specify that an object is not modifiable and that any attempt to modify the object should result in a compilation error.
- ▶ C++ disallows member function calls for **const objects** unless the member functions themselves are also declared **const**.
 - True even for *get member functions that do not modify the object.*
- ▶ A member function is specified as **const both in its prototype and in its definition.**

Software Engineering Observation 10.1

Attempts to modify a `const` object are caught at compile time rather than causing execution-time errors.

Performance Tip 10.1

Declaring variables and objects `const` when appropriate can improve performance—compilers can perform certain optimizations on constants that cannot be performed on variables.

Software Engineering Observation 10.2

A const member function can be overloaded with a non-const version. The compiler chooses which overloaded member function to use based on the object on which the function is invoked. If the object is const, the compiler uses the const version. If the object is not const, the compiler uses the non-const version.

Common Programming Error 10.4

Attempting to declare a constructor or destructor const is a compilation error.

```
1 // Fig. 10.1: Time.h
2 // Time class definition with const member functions.
3 // Member functions defined in Time.cpp.
4 #ifndef TIME_H
5 #define TIME_H
6
7 class Time
8 {
9 public:
10    Time( int = 0, int = 0, int = 0 ); // default constructor
11
12    // set functions
13    void setTime( int, int, int ); // set time
14    void setHour( int ); // set hour
15    void setMinute( int ); // set minute
16    void setSecond( int ); // set second
17
18    // get functions (normally declared const)
19    int getHour() const; // return hour
20    int getMinute() const; // return minute
21    int getSecond() const; // return second
22
```

Fig. 10.1 | Time class definition with const member functions. (Part I of 2.)

```
23     // print functions (normally declared const)
24     void printUniversal() const; // print universal time
25     void printStandard(); // print standard time (should be const)
26 private:
27     int hour; // 0 - 23 (24-hour clock format)
28     int minute; // 0 - 59
29     int second; // 0 - 59
30 }; // end class Time
31
32 #endif
```

Fig. 10.1 | Time class definition with `const` member functions. (Part 2 of 2.)

```
1 // Fig. 10.2: Time.cpp
2 // Time class member-function definitions.
3 #include <iostream>
4 #include <iomanip>
5 #include "Time.h" // include definition of class Time
6 using namespace std;
7
8 // constructor function to initialize private data;
9 // calls member function setTime to set variables;
10 // default values are 0 (see class definition)
11 Time::Time( int hour, int minute, int second )
12 {
13     setTime( hour, minute, second );
14 } // end Time constructor
15
16 // set hour, minute and second values
17 void Time::setTime( int hour, int minute, int second )
18 {
19     setHour( hour );
20     setMinute( minute );
21     setSecond( second );
22 } // end function setTime
```

Fig. 10.2 | Time class member-function definitions. (Part I of 4.)

```
23
24 // set hour value
25 void Time::setHour( int h )
26 {
27     hour = ( h >= 0 && h < 24 ) ? h : 0; // validate hour
28 } // end function setHour
29
30 // set minute value
31 void Time::setMinute( int m )
32 {
33     minute = ( m >= 0 && m < 60 ) ? m : 0; // validate minute
34 } // end function setMinute
35
36 // set second value
37 void Time::setSecond( int s )
38 {
39     second = ( s >= 0 && s < 60 ) ? s : 0; // validate second
40 } // end function setSecond
41
42 // return hour value
43 int Time::getHour() const // get functions should be const
44 {
45     return hour;
46 } // end function getHour
```

Fig. 10.2 | Time class member-function definitions. (Part 2 of 4.)

```
47
48 // return minute value
49 int Time::getMinute() const
50 {
51     return minute;
52 } // end function getMinute
53
54 // return second value
55 int Time::getSecond() const
56 {
57     return second;
58 } // end function getSecond
59
60 // print Time in universal-time format (HH:MM:SS)
61 void Time::printUniversal() const
62 {
63     cout << setfill( '0' ) << setw( 2 ) << hour << ":"
64         << setw( 2 ) << minute << ":" << setw( 2 ) << second;
65 } // end function printUniversal
66
```

Fig. 10.2 | Time class member-function definitions. (Part 3 of 4.)

```
67 // print Time in standard-time format (HH:MM:SS AM or PM)
68 void Time::printStandard() // note lack of const declaration
69 {
70     cout << ( ( hour == 0 || hour == 12 ) ? 12 : hour % 12 )
71         << ":" << setfill( '0' ) << setw( 2 ) << minute
72         << ":" << setw( 2 ) << second << ( hour < 12 ? " AM" : " PM" );
73 } // end function printStandard
```

Fig. 10.2 | Time class member-function definitions. (Part 4 of 4.)

```
1 // Fig. 10.3: fig10_03.cpp
2 // Attempting to access a const object with non-const member functions.
3 #include "Time.h" // include Time class definition
4
5 int main()
6 {
7     Time wakeUp( 6, 45, 0 ); // non-constant object
8      const Time noon( 12, 0, 0 ); // constant object
9
10
11     wakeUp.setHour( 18 ); // OBJECT           MEMBER FUNCTION
12
13     noon.setHour( 12 ); // const            non-const
14
15     wakeUp.getHour(); // non-const        const
16
17     noon.getMinute(); // const            const
18     noon.printUniversal(); // const          const
19
20     noon.printStandard(); // const            non-const
21 } // end main
```

Fig. 10.3 | const objects and const member functions. (Part I of 2.)

10.2 `const` (Constant) Objects and `const` Member Functions (cont.)

- ▶ Member initializer syntax
- ▶ All data members can be initialized using member initializer syntax, but **const** data members and data members that are references must be initialized using member initializers.
- ▶ Member initializers appear between a constructor's parameter list and the left brace that begins the constructor's body.
 - Separated from the parameter list with a colon (:).
 - Each member initializer consists of the data member name followed by parentheses containing the member's initial value.

```
class A
{
public:
    A();
private:
    int& ref;
};
```

```
1 // Fig. 10.4: Increment.h
2 // Definition of class Increment.
3 #ifndef INCREMENT_H
4 #define INCREMENT_H
5
6 class Increment
7 {
8 public:
9     Increment( int c = 0, int i = 1 ); // default constructor
10
11    // function addIncrement definition
12    void addIncrement()
13    {
14        count += increment;
15    } // end function addIncrement
16
17    void print() const; // prints count and increment
18 private:
19    int count;
20    const int increment; // const data member
21}; // end class Increment
22
23#endif
```

Fig. 10.4 | Increment class definition containing non-const data member count and const data member increment.

```
1 // Fig. 10.5: Increment.cpp
2 // Member-function definitions for class Increment demonstrate using a
3 // member initializer to initialize a constant of a built-in data type.
4 #include <iostream>
5 #include "Increment.h" // include definition of class Increment
6 using namespace std;
7
8 // constructor
9 Increment::Increment( int c, int i )
10 ★ : count( c ), // initializer for non-const member
11      increment( i ) // required initializer for const member
12 {
13     // empty body
14 } // end constructor Increment
15
16 // print count and increment values
17 void Increment::print() const
18 {
19     cout << "count = " << count << ", increment = " << increment << endl;
20 } // end function print
```

Fig. 10.5 | Member initializer used to initialize a constant of a built-in data type.

```
1 // Fig. 10.6: fig10_06.cpp
2 // Program to test class Increment.
3 #include <iostream>
4 #include "Increment.h" // include definition of class Increment
5 using namespace std;
6
7 int main()
8 {
9     Increment value( 10, 5 );
10
11    cout << "Before incrementing: ";
12    value.print();
13
14    for ( int j = 1; j <= 3; j++ )
15    {
16        value.addIncrement();
17        cout << "After increment " << j << ": ";
18        value.print();
19    } // end for
20 } // end main
```

Fig. 10.6 | Invoking an `Increment` object's `print` and `addIncrement` member functions.

```
Before incrementing: count = 10, increment = 5  
After increment 1: count = 15, increment = 5  
After increment 2: count = 20, increment = 5  
After increment 3: count = 25, increment = 5
```

Fig. 10.6 | Invoking an Increment object's print and addIncrement member functions.

Software Engineering Observation 10.3

A `const` object cannot be modified by assignment, so it must be initialized. When a data member of a class is declared `const`, a member initializer must be used to provide the constructor with the initial value of the data member for an object of the class. The same is true for references.

Common Programming Error 10.5

Not providing a member initializer for a `const` data member is a compilation error.

```
1 // Fig. 10.7: Increment.h
2 // Definition of class Increment.
3 #ifndef INCREMENT_H
4 #define INCREMENT_H
5
6 class Increment
7 {
8 public:
9     Increment( int c = 0, int i = 1 ); // default constructor
10
11    // function addIncrement definition
12    void addIncrement()
13    {
14        count += increment;
15    } // end function addIncrement
16
17    void print() const; // prints count and increment
18 private:
19    int count;
20    const int increment; // const data member
21}; // end class Increment
22
23#endif
```

Fig. 10.7 | Increment class definition containing non-const data member count and const data member increment.

```
1 // Fig. 10.8: Increment.cpp
2 // Erroneous attempt to initialize a constant of a built-in data
3 // type by assignment.
4 #include <iostream>
5 #include "Increment.h" // include definition of class Increment
6 using namespace std;
7
8 // constructor; constant member 'increment' is not initialized
9 ★ Increment::Increment( int c, int i )
10 {
11     count = c; // allowed because count is not constant
12     increment = i; // ERROR: Cannot modify a const object
13 } // end constructor Increment
14
15 // print count and increment values
16 void Increment::print() const
17 {
18     cout << "count = " << count << ", increment = " << increment << endl;
19 } // end function print
```

Fig. 10.8 | Erroneous attempt to initialize a constant of a built-in data type by assignment.

10.3 Composition: Objects as Members of Classes

- ▶ **Composition**
 - Sometimes referred to as a **has-a relationship**
 - A class can have objects of other classes as members
- ▶ An object's constructor can pass arguments to member-object constructors via member initializers.

Software Engineering Observation 10.5

A common form of software reusability is composition, in which a class has objects of other classes as members.

Software Engineering Observation 10.6

*Member objects are constructed in the order in which they're declared in the class definition (not in the order they're listed in the constructor's member initializer list) and before their enclosing class objects (sometimes called **host objects**) are constructed.*

```
1 // Fig. 10.10: Date.h
2 // Date class definition; Member functions defined in Date.cpp
3 #ifndef DATE_H
4 #define DATE_H
5
6 class Date
7 {
8 public:
9     static const int monthsPerYear = 12; // number of months in a year
10    Date( int = 1, int = 1, int = 1900 ); // default constructor
11    void print() const; // print date in month/day/year format
12    ~Date(); // provided to confirm destruction order
13 private:
14     int month; // 1-12 (January-December)
15     int day; // 1-31 based on month
16     int year; // any year
17
18     // utility function to check if day is proper for month and year
19     int checkDay( int ) const;
20 }; // end class Date
21
22 #endif
```

Fig. 10.10 | Date class definition.

```
1 // Fig. 10.11: Date.cpp
2 // Date class member-function definitions.
3 #include <iostream>
4 #include "Date.h" // include Date class definition
5 using namespace std;
6
7 // constructor confirms proper value for month; calls
8 // utility function checkDay to confirm proper value for day
9 Date::Date( int mn, int dy, int yr )
10 {
11     if ( mn > 0 && mn <= monthsPerYear ) // validate the month
12         month = mn;
13     else
14     {
15         month = 1; // invalid month set to 1
16         cout << "Invalid month (" << mn << ") set to 1.\n";
17     } // end else
18
19     year = yr; // could validate yr
20     day = checkDay( dy ); // validate the day
21
22     // output Date object to show when its constructor is called
23     cout << "Date object constructor for date ";
```

Fig. 10.11 | Date class member-function definitions. (Part I of 3.)

```
24     print();
25     cout << endl;
26 } // end Date constructor
27
28 // print Date object in form month/day/year
29 void Date::print() const
30 {
31     cout << month << '/' << day << '/' << year;
32 } // end function print
33
34 // output Date object to show when its destructor is called
35 Date::~Date()
36 {
37     cout << "Date object destructor for date ";
38     print();
39     cout << endl;
40 } // end ~Date destructor
41
42 // utility function to confirm proper day value based on
43 // month and year; handles leap years, too
44 int Date::checkDay( int testDay ) const
45 {
46     static const int daysPerMonth[ monthsPerYear + 1 ] =
47         { 0, 31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31 };
```

Fig. 10.11 | Date class member-function definitions. (Part 2 of 3.)

```
48
49     // determine whether testDay is valid for specified month
50     if ( testDay > 0 && testDay <= daysPerMonth[ month ] )
51         return testDay;
52
53     // February 29 check for leap year
54     if ( month == 2 && testDay == 29 && ( year % 400 == 0 ||
55         ( year % 4 == 0 && year % 100 != 0 ) ) )
56         return testDay;
57
58     cout << "Invalid day (" << testDay << ") set to 1.\n";
59     return 1; // leave object in consistent state if bad value
60 } // end function checkDay
```

Fig. 10.11 | Date class member-function definitions. (Part 3 of 3.)

```
1 // Fig. 10.12: Employee.h
2 // Employee class definition showing composition.
3 // Member functions defined in Employee.cpp.
4 #ifndef EMPLOYEE_H
5 #define EMPLOYEE_H
6
7 #include <string>
8 #include "Date.h" // include Date class definition
9 using namespace std;
10
11 class Employee
12 {
13 public:
14     Employee( const string &, const string &,
15               const Date &, const Date & );
16     void print() const;
17     ~Employee(); // provided to confirm destruction order
18 private:
19     string firstName; // composition: member object
20     string lastName; // composition: member object
21     const Date birthDate; // composition: member object
22     const Date hireDate; // composition: member object
23 }; // end class Employee
24
25 #endif
```

Fig. 10.12 | Employee class definition showing composition.

```
1 // Fig. 10.13: Employee.cpp
2 // Employee class member-function definitions.
3 #include <iostream>
4 #include "Employee.h" // Employee class definition
5 #include "Date.h" // Date class definition
6 using namespace std;
7
8 // constructor uses member initializer list to pass initializer
9 // values to constructors of member objects
10 Employee::Employee( const string &first, const string &last,
11                      const Date &dateOfBirth, const Date &dateOfHire )
12 : firstName( first ), // initialize firstName
13     lastName( last ), // initialize lastName
14     birthDate( dateOfBirth ), // initialize birthDate
15     hireDate( dateOfHire ) // initialize hireDate
16 {
17     // output Employee object to show when constructor is called
18     cout << "Employee object constructor: "
19         << firstName << ' ' << lastName << endl;
20 } // end Employee constructor
21
```

Fig. 10.13 | Employee class member-function definitions, including constructor with a member initializer list. (Part 1 of 2.)

```
22 // print Employee object
23 void Employee::print() const
24 {
25     cout << lastName << ", " << firstName << " Hired: ";
26     hireDate.print();
27     cout << " Birthday: ";
28     birthDate.print();
29     cout << endl;
30 } // end function print
31
32 // output Employee object to show when its destructor is called
33 Employee::~Employee()
34 {
35     cout << "Employee object destructor: "
36         << lastName << ", " << firstName << endl;
37 } // end ~Employee destructor
```

Fig. 10.13 | Employee class member-function definitions, including constructor with a member initializer list. (Part 2 of 2.)

10.3 Composition: Objects as Members of Classes (cont.)

- ▶ As you study class **Date** (Fig. 10.10), notice that the class does not provide a constructor that receives a parameter of type **Date**.
- ▶ Why can the **Employee** constructor's member initializer list initialize the **birthDate** and **hireDate** objects by passing **Date** object's to their **Date** constructors?
- ▶ The compiler provides each class with a default copy constructor that copies each data member of the constructor's argument object into the corresponding member of the object being initialized.

```
1 // Fig. 10.14: fig10_14.cpp
2 // Demonstrating composition--an object with member objects.
3 #include <iostream>
4 #include "Employee.h" // Employee class definition
5 using namespace std;
6
7 int main()
8 {
9     Date birth( 7, 24, 1949 );
10    Date hire( 3, 12, 1988 );
11    Employee manager( "Bob", "Blue", birth, hire );
12
13    cout << endl;
14    manager.print();
15
16    cout << "\nTest Date constructor with invalid values:\n";
17    Date lastDayOff( 14, 35, 1994 ); // invalid month and day
18    cout << endl;
19 } // end main
```

Fig. 10.14 | Demonstrating composition—an object with member objects. (Part I of 2.)

```
Date object constructor for date 7/24/1949  
Date object constructor for date 3/12/1988  
Employee object constructor: Bob Blue
```

```
Blue, Bob Hired: 3/12/1988 Birthday: 7/24/1949
```

```
Test Date constructor with invalid values:  
Invalid month (14) set to 1.  
Invalid day (35) set to 1.  
Date object constructor for date 1/1/1994
```

```
Date object destructor for date 1/1/1994
```

```
Employee object destructor: Blue, Bob
```

```
Date object destructor for date 3/12/1988
```

```
Date object destructor for date 7/24/1949
```

```
Date object destructor for date 3/12/1988
```

```
Date object destructor for date 7/24/1949
```

There are actually five constructor calls when an `Employee` is constructed—two calls to the `string` class's constructor (lines 12–13 of Fig. 10.13), two calls to the `Date` class's default copy constructor (lines 14–15 of Fig. 10.13) and the call to the `Employee` class's constructor.

Fig. 10.14 | Demonstrating composition—an object with member objects. (Part 2 of 2.)

10.3 Composition: Objects as Members of Classes (cont.)

- ▶ If a member object is **not initialized through a member initializer**, the member object's default constructor will be called implicitly.
- ▶ Values, if any, established by the default constructor can be overridden by *set functions*.

10.4 friend Functions and friend Classes

- ▶ A **friend function** of a class is defined outside that class's scope, yet **has the right to access the non-public (and public)** members of the class.
- ▶ Standalone functions, entire classes or member functions of other classes may be declared to be friends of **another class**.
- ▶ Using **friend** functions can **enhance performance**.

Software Engineering Observation 10.8

Even though the prototypes for friend functions appear in the class definition, friends are not member functions.

Software Engineering Observation 10.9

Member access notions of private, protected and public are not relevant to friend declarations, so friend declarations can be placed anywhere in a class definition.

Software Engineering Observation 10.10

*Some people in the OOP community feel that
“friendship” corrupts information hiding and weakens
the value of the object-oriented design approach. In this
text, we identify several examples of the responsible use of
friendship.*

```
1 // Fig. 10.15: fig10_15.cpp
2 // Friends can access private members of a class.
3 #include <iostream>
4 using namespace std;
5
6 // Count class definition
7 class Count
8 {
9     friend void setX( Count &, int ); // friend declaration
10 public:
11     // constructor
12     Count()
13         : x( 0 ) // initialize x to 0
14     {
15         // empty body
16     } // end constructor Count
17
18     // output x
19     void print() const
20     {
21         cout << x << endl;
22     } // end function print
```

Fig. 10.15 | Friends can access private members of a class. (Part I of 3.)

```
23 private:
24     int x; // data member
25 }; // end class Count
26
27 // function setX can modify private data of Count
28 // because setX is declared as a friend of Count (line 9)
29 void setX( Count &c, int val )
30 {
31     c.x = val; // allowed because setX is a friend of Count
32 } // end function setX
33
34 int main()
35 {
36     Count counter; // create Count object
37
38     cout << "counter.x after instantiation: ";
39     counter.print();
40
41     setX( counter, 8 ); // set x using a friend function
42     cout << "counter.x after call to setX friend function: ";
43     counter.print();
44 } // end main
```

Fig. 10.15 | Friends can access private members of a class. (Part 2 of 3.)

```
counter.x after instantiation: 0  
counter.x after call to setX friend function: 8
```

Fig. 10.15 | Friends can access private members of a class. (Part 3 of 3.)

```
#include <iostream.h>
```

```
class A {  
    friend class B;  
public:  
    A(int r=0)    {x=r;}  
    ~A(){}  
private:  
    int x;  
};
```

```
class B {  
public:  
    B(int r=0)    {y=r;}  
    ~B(){}  
    int g(A &a){ return a.x+y;}  
private:  
    int y;  
};
```

```
main()  
{  
    A a(3);  
    B b(12);  
    cout<< "g(3) = "<< b.g(a)<< endl;  
}
```

10.5 Using the `this` Pointer

- ▶ Every object has access to its own address through a pointer called `this` (a C++ keyword).
- ▶ The `this` pointer is not part of the object itself.
- ▶ Objects use the `this` pointer implicitly or explicitly to reference their data members and member functions.
- ▶ The type of the `this` pointer depends on the type of the object and whether the member function in which `this` is used is declared `const`.

```
1 // Fig. 10.16: fig10_16.cpp
2 // Using the this pointer to refer to object members.
3 #include <iostream>
4 using namespace std;
5
6 class Test
7 {
8 public:
9     Test( int = 0 ); // default constructor
10    void print() const;
11 private:
12    int x;
13}; // end class Test
14
15 // constructor
16 Test::Test( int value )
17     : x( value ) // initialize x to value
18 {
19     // empty body
20 } // end constructor Test
```

Fig. 10.16 | this pointer implicitly and explicitly accessing an object's members.
(Part I of 3.)

```
21
22 // print x using implicit and explicit this pointers;
23 // the parentheses around *this are required
24 void Test::print() const
25 {
26     // implicitly use the this pointer to access the member x
27     cout << "          x = " << x;
28
29     // explicitly use the this pointer and the arrow operator
30     // to access the member x
31     cout << "\n  this->x = " << this->x;
32
33     // explicitly use the dereferenced this pointer and
34     // the dot operator to access the member x
35     cout << "\n(*this).x = " << ( *this ).x << endl;
36 } // end function print
37
38 int main()
39 {
40     Test testObject( 12 ); // instantiate and initialize testObject
41
42     testObject.print();
43 } // end main
```

Fig. 10.16 | this pointer implicitly and explicitly accessing an object's members.
(Part 2 of 3.)

```
x = 12  
this->x = 12  
(*this).x = 12
```

Fig. 10.16 | this pointer implicitly and explicitly accessing an object's members.
(Part 3 of 3.)

10.5 Using the `this` Pointer (cont.)

- ▶ Another use of the `this` pointer is to enable **cascaded member-function calls**
 - invoking multiple functions in the same statement

```
1 // Fig. 10.17: Time.h
2 // Cascading member function calls.
3
4 // Time class definition.
5 // Member functions defined in Time.cpp.
6 #ifndef TIME_H
7 #define TIME_H
8
9 class Time
10 {
11 public:
12     Time( int = 0, int = 0, int = 0 ); // default constructor
13
14     // set functions (the Time & return types enable cascading)
15     Time &setTime( int, int, int ); // set hour, minute, second
16     Time &setHour( int ); // set hour
17     Time &setMinute( int ); // set minute
18     Time &setSecond( int ); // set second
19
20     // get functions (normally declared const)
21     int getHour() const; // return hour
22     int getMinute() const; // return minute
23     int getSecond() const; // return second
```

Fig. 10.17 | Time class definition modified to enable cascaded member-function calls. (Part I of 2.)

```
24
25     // print functions (normally declared const)
26     void printUniversal() const; // print universal time
27     void printStandard() const; // print standard time
28 private:
29     int hour; // 0 - 23 (24-hour clock format)
30     int minute; // 0 - 59
31     int second; // 0 - 59
32 }; // end class Time
33
34 #endif
```

Fig. 10.17 | Time class definition modified to enable cascaded member-function calls. (Part 2 of 2.)

```
1 // Fig. 10.18: Time.cpp
2 // Time class member-function definitions.
3 #include <iostream>
4 #include <iomanip>
5 #include "Time.h" // Time class definition
6 using namespace std;
7
8 // constructor function to initialize private data;
9 // calls member function setTime to set variables;
10 // default values are 0 (see class definition)
11 Time::Time( int hr, int min, int sec )
12 {
13     setTime( hr, min, sec );
14 } // end Time constructor
15
16 // set values of hour, minute, and second
17 Time &Time::setTime( int h, int m, int s ) // note Time & return
18 {
19     setHour( h );
20     setMinute( m );
21     setSecond( s );
22     return *this; // enables cascading
23 } // end function setTime
```

Fig. 10.18 | Time class member-function definitions modified to enable cascaded member-function calls. (Part I of 4.)

```
24
25 // set hour value
26 Time &Time::setHour( int h ) // note Time & return
27 {
28     hour = ( h >= 0 && h < 24 ) ? h : 0; // validate hour
29     return *this; // enables cascading
30 } // end function setHour
31
32 // set minute value
33 Time &Time::setMinute( int m ) // note Time & return
34 {
35     minute = ( m >= 0 && m < 60 ) ? m : 0; // validate minute
36     return *this; // enables cascading
37 } // end function setMinute
38
39 // set second value
40 Time &Time::setSecond( int s ) // note Time & return
41 {
42     second = ( s >= 0 && s < 60 ) ? s : 0; // validate second
43     return *this; // enables cascading
44 } // end function setSecond
45
```

Fig. 10.18 | Time class member-function definitions modified to enable cascaded member-function calls. (Part 2 of 4.)

```
46 // get hour value
47 int Time::getHour() const
48 {
49     return hour;
50 } // end function getHour
51
52 // get minute value
53 int Time::getMinute() const
54 {
55     return minute;
56 } // end function getMinute
57
58 // get second value
59 int Time::getSecond() const
60 {
61     return second;
62 } // end function getSecond
63
```

Fig. 10.18 | Time class member-function definitions modified to enable cascaded member-function calls. (Part 3 of 4.)

```
64 // print Time in universal-time format (HH:MM:SS)
65 void Time::printUniversal() const
66 {
67     cout << setfill( '0' ) << setw( 2 ) << hour << ":"
68         << setw( 2 ) << minute << ":" << setw( 2 ) << second;
69 } // end function printUniversal
70
71 // print Time in standard-time format (HH:MM:SS AM or PM)
72 void Time::printStandard() const
73 {
74     cout << ( ( hour == 0 || hour == 12 ) ? 12 : hour % 12 )
75         << ":" << setfill( '0' ) << setw( 2 ) << minute
76         << ":" << setw( 2 ) << second << ( hour < 12 ? " AM" : " PM" );
77 } // end function printStandard
```

Fig. 10.18 | Time class member-function definitions modified to enable cascaded member-function calls. (Part 4 of 4.)

```
1 // Fig. 10.19: fig10_19.cpp
2 // Cascading member-function calls with the this pointer.
3 #include <iostream>
4 #include "Time.h" // Time class definition
5 using namespace std;
6
7 int main()
8 {
9     Time t; // create Time object
10
11    // cascaded function calls
12    t.setHour( 18 ).setMinute( 30 ).setSecond( 22 );
13
14    // output time in universal and standard formats
15    cout << "Universal time: ";
16    t.printUniversal();
17
18    cout << "\nStandard time: ";
19    t.printStandard();
20
21    cout << "\n\nNew standard time: ";
22
```

Fig. 10.19 | Cascading member-function calls with the `this` pointer. (Part I of 2.)

```
23 // cascaded function calls
24 t.setTime( 20, 20, 20 ).printStandard();
25 cout << endl;
26 } // end main
```

Universal time: 18:30:22
Standard time: 6:30:22 PM

New standard time: 8:20:20 PM

Fig. 10.19 | Cascading member-function calls with the `this` pointer. (Part 2 of 2.)

10.5 Using the `this` Pointer (cont.)

- ▶ Why does the technique of returning `*this` as a reference work? The dot operator (`.`) associates from left to right, so line 12 first evaluates `t.setHour(18)`, then returns a reference to object `t` as the value of this function call.
- ▶ The remaining expression is then interpreted as
 - `t.setMinute(30).setSecond(22);`
- ▶ The `t.setMinute(30)` call executes and returns a reference to the object `t`.
- ▶ The remaining expression is interpreted as
 - `t.setSecond(22);`

10.6 static Class Members

- ▶ In certain cases, only one copy of a variable should be shared by all objects of a class.
- ▶ A **static data member** is used for these and other reasons.
- ▶ Such a variable represents “class-wide” information.

Performance Tip 10.3

Use static data members to save storage when a single copy of the data for all objects of a class will suffice.

10.6 static Class Members (cont.)

- ▶ Although they may seem like global variables, a class's **static** data members have class scope.
- ▶ **static** members can be declared **public**, **private** or **protected**.
- ▶ A fundamental-type **static** data member is initialized **by default** to **0**.
- ▶ If you want a different initial value, a **static** data member **can be initialized once**.

10.6 static Class Members (cont.)

- ▶ If a **static** data member is an object of a class that provides a default constructor, the **static** data member **need not be initialized** because its default constructor will be called.
- ▶ A class's **private static** members are normally accessed through the class's **public** member functions.
- ▶ A class's **static** members **exist even when no objects of that class exist.**

10.6 static Class Members (cont.)

- ▶ To access a **public static** class member when no objects of the class exist, **prefix the class name and the binary scope resolution operator (::) to the name of the data member.**
- ▶ To access a **private** class member when no objects of the class exist, **provide a public static member function and call the function by prefixing its name with the class name and binary scope resolution operator.**
- ▶ A **static** member function is a service of the *class*, not of a specific object of the class.

Software Engineering Observation 10.11

A class's static data members and static member functions exist and can be used even if no objects of that class have been instantiated.

```
1 // Fig. 10.20: Employee.h
2 // Employee class definition with a static data member to
3 // track the number of Employee objects in memory
4 #ifndef EMPLOYEE_H
5 #define EMPLOYEE_H
6
7 #include <string>
8 using namespace std;
9
10 class Employee
11 {
12 public:
13     Employee( const string &, const string & ); // constructor
14     ~Employee(); // destructor
15     string getFirstName() const; // return first name
16     string getLastNames() const; // return last name
17
18     // static member function
19     static int getCount(); // return number of objects instantiated
20 private:
21     string firstName;
22     string lastName;
```

Fig. 10.20 | Employee class definition with a **static** data member to track the number of Employee objects in memory. (Part I of 2.)

```
23
24     // static data
25     static int count; // number of objects instantiated
26 }; // end class Employee
27
28 #endif
```

Fig. 10.20 | Employee class definition with a **static** data member to track the number of Employee objects in memory. (Part 2 of 2.)

```
1 // Fig. 10.21: Employee.cpp
2 // Employee class member-function definitions.
3 #include <iostream>
4 #include "Employee.h" // Employee class definition
5 using namespace std;
6
7 // define and initialize static data member at global namespace scope
8 int Employee::count = 0; // cannot include keyword static
9
10 // define static member function that returns number of
11 // Employee objects instantiated (declared static in Employee.h)
12 int Employee::getCount()
13 {
14     return count;
15 } // end static function getCount
16
17 // constructor initializes non-static data members and
18 // increments static data member count
19 Employee::Employee( const string &first, const string &last )
20     : firstName( first ), lastName( last )
21 {
22     ++count; // increment static count of employees
```

Fig. 10.21 | Employee class member-function definitions. (Part I of 2.)

```
23     cout << "Employee constructor for " << firstName
24         << ' ' << lastName << " called." << endl;
25 } // end Employee constructor
26
27 // destructor deallocates dynamically allocated memory
28 Employee::~Employee()
29 {
30     cout << "~Employee() called for " << firstName
31         << ' ' << lastName << endl;
32     --count; // decrement static count of employees
33 } // end ~Employee destructor
34
35 // return first name of employee
36 string Employee::getFirstName() const
37 {
38     return firstName; // return copy of first name
39 } // end function getFirstName
40
41 // return last name of employee
42 string Employee::getLastName() const
43 {
44     return lastName; // return copy of last name
45 } // end function getLastName
```

Fig. 10.21 | Employee class member-function definitions. (Part 2 of 2.)

```
1 // Fig. 10.22: fig10_22.cpp
2 // static data member tracking the number of objects of a class.
3 #include <iostream>
4 #include "Employee.h" // Employee class definition
5 using namespace std;
6
7 int main()
8 {
9     // no objects exist; use class name and binary scope resolution
10    // operator to access static member function getCount
11    cout << "Number of employees before instantiation of any objects is "
12        << Employee::getCount() << endl; // use class name
13
14    // the following scope creates and destroys
15    // Employee objects before main terminates
16    {
17        Employee e1( "Susan", "Baker" );
18        Employee e2( "Robert", "Jones" );
19
20        // two objects exist; call static member function getCount again
21        // using the class name and the binary scope resolution operator
22        cout << "Number of employees after objects are instantiated is "
23            << Employee::getCount();
```

Fig. 10.22 | static data member tracking the number of objects of a class. (Part I of 3.)

```
24
25     cout << "\n\nEmployee 1: "
26         << e1.getFirstName() << " " << e1.getLastName()
27         << "\nEmployee 2: "
28         << e2.getFirstName() << " " << e2.getLastName() << "\n\n";
29 } // end nested scope in main
30
31 // no objects exist, so call static member function getCount again
32 // using the class name and the binary scope resolution operator
33 cout << "\nNumber of employees after objects are deleted is "
34     << Employee::getCount() << endl;
35 } // end main
```

Fig. 10.22 | static data member tracking the number of objects of a class. (Part 2 of 3.)

Number of employees before instantiation of any objects is 0
Employee constructor for Susan Baker called.

Employee constructor for Robert Jones called.

Number of employees after objects are instantiated is 2

Employee 1: Susan Baker

Employee 2: Robert Jones

~Employee() called for Robert Jones

~Employee() called for Susan Baker

Number of employees after objects are deleted is 0

Fig. 10.22 | static data member tracking the number of objects of a class. (Part 3 of 3.)

10.6 static Class Members (cont.)

- ▶ A member function should be declared **static** if it does not access non-**static** data members or non-**static** member functions of the class.
- ▶ A **static** member function does not have a **this** pointer, because **static** data members and **static** member functions exist independently of any objects of a class.
- ▶ The **this** pointer must refer to a specific object of the class, and when a **static** member function is called, there might not be any objects of its class in memory.

```
class Something
{
private:
    static int s_nValue;

public:
    static int GetValue() {
        return s_nValue;
    }
};

int Something::s_nValue = 1; // initializer

int main()
{
    std::cout << Something::GetValue() << std::endl;
}
```

Common Programming Error 10.9

*Using the this pointer in a static member function
is a compilation error.*

Common Programming Error 10.10

Declaring a static member function const is a compilation error. The `const` qualifier indicates that a function cannot modify the contents of the object in which it operates, but `static` member functions exist and operate independently of any objects of the class.

10.7 Data Abstraction and Information Hiding

- ▶ Classes normally hide the details of their implementation from their clients.
- ▶ This is called **information hiding**.
- ▶ This concept is referred to as **data abstraction**.
- ▶ As long as the **public** services of the class do not change (i.e., every original **public** member function still has the same prototype in the new class definition), the rest of the system is not affected.

Software Engineering Observation 10.12

You can create new types through the class mechanism.

These new types can be designed to be used as conveniently as the fundamental types. Thus, C++ is an extensible language. Although the language is easy to extend with these new types, the base language itself cannot be changed.
